

## Emphysematous Cholecystitis

**A**N 83-YEAR-OLD MAN WAS BEING TREATED FOR DIABETES MELLITUS, hypertension, and ischemic heart disease. Cholelithiasis had previously been detected by abdominal ultrasonography. After drinking alcohol at home, the patient had acute abdominal pain. Plain-film radiography of the abdomen (Panel A) showed air (arrow) in the upper right quadrant, and computed tomography (Panel B) showed an air–fluid level (arrow) in the lumen of the gallbladder and gas (arrowhead) within the gallbladder wall. After antibiotic therapy, cholecystectomy and drainage were performed. *Clostridium perfringens* was isolated from the culture of drained biliary fluid. The patient recovered uneventfully.
